### **Problem Statement:**

For the mass spring system derive expressions for  $\zeta$  and  $\omega_n$ . If **M=10 Kg**, determine spring and friction constant for following cases:

1. 
$$\zeta = 0.7$$
,  $\omega n = 10$ 

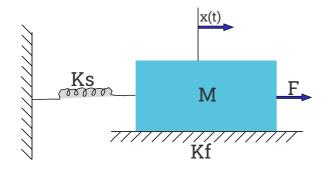

2. 
$$\zeta = 0.3$$
,  $\omega n = 10$ 

3. 
$$\zeta = 0.01$$
,  $\omega n = 10$ 

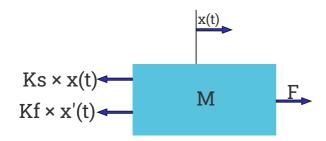

Show the plots for step responses and pole-zero locations in MATLAB.

### Solution

Mass Spring System

• Free Body Diagram

According to Newton's Laws of motion:

$$F(t) - \{K_s x(t) + K_f \frac{\mathrm{d}x(t)}{\mathrm{d}t}\} = M \frac{\partial^2 x(t)}{\partial t^2}$$

$$f(t) \Rightarrow u(t)|x(t) \Rightarrow y(t)$$

$$u(t) = M \frac{\partial^2 y(t)}{\partial t^2} + K_s y(t) + K_f \frac{\partial y(t)}{\partial t}$$

#### In Laplace Domain

$$U(S) = [MS^2 + K_s + K_f S] \times Y(S)$$

$$\frac{Y(S)}{U(S)} = G(S) = \frac{1}{MS^2 + K_fS + K_s}$$

Comparing with the Standard Second Order Equation

$$G(S) = \frac{\omega_n^2}{S^2 + 2\zeta\omega_n S + \omega_n^2}$$

$$\omega_n = \sqrt{\frac{K_s}{M}} \text{ and } \zeta = \frac{K_f}{2\sqrt{K_s M}}$$

$$K_s = \omega_n^2 imes M_{
m and} \, K_f = 2\zeta imes \sqrt{K_s imes M}$$

### Case 1:

- **M** = 10 Kg
- $\zeta = 0.7$
- $\omega_n = 10$
- $K_s = 1000 N/m$
- $K_f = 140N/m^2$

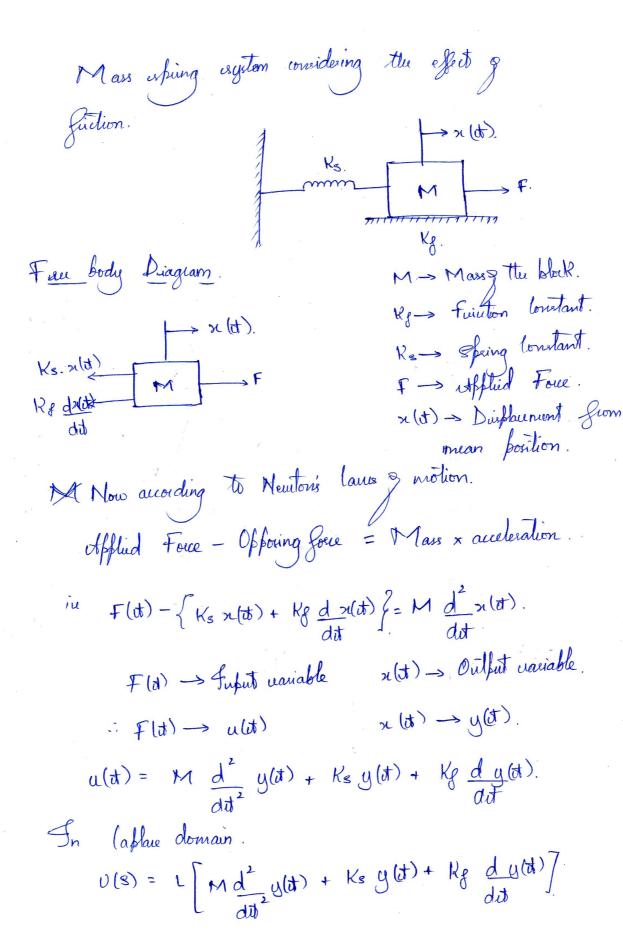

#### Case 2:

- **M** = 10 Kg
- $\zeta = 0.3$
- $\omega_n = 10$
- $K_s = 1000 N/m$
- $K_f = 60N/m^2$

#### Case 3:

- **M** = 10 Kg
- $\zeta = 0.01$
- $\omega_n = 10$
- $K_s = 1000 N/m$
- $K_f = 2N/m^2$

# **Derivation and Calculations**

$$U(s) = M \left[ s^{2} Y(s) - sy(0) + y'(0) \right] + K_{8} Y(s) + kg \left[ sy(s) - y(0) \right]$$

$$(Ascuming the Aboth & mass M is at vest winitially.$$

$$u: Guitial conditions are 'o'.$$

$$u: y(0) = y'(0) = 0$$

$$U(s) = \left[ M s^{2} + K_{8} + K_{9} s \right] Y(s).$$

$$Now G(s) = \frac{1}{M s^{2} + K_{9} s + K_{8}} = \frac{1}{M s^{2} + K_{9} s + K_{9}} = \frac{1}{M s^{2} + K_{9}$$

(a) Case 1: 
$$Z = 0.4$$
,  $\omega_n = 10$ 
 $K_s = \omega_n^2 \times M = 10 \times 10 \times 10 = \frac{1000}{N} M M$ 
 $K_f = 2 \times \sqrt{K_S M} = 2 \times 0.4$   $\sqrt{1000 \times 10} = 1.4 \times 100 = 140 N M^{-1}$ 

Poles are located at:  $P_s$ ,  $P_s$ 
 $= \frac{2}{2} + 2 \times 2 \omega_n + \omega_n^2$ 
 $\omega_n = \underline{\omega}$ .

 $P_s$ ,  $P_s = -2 \times 2 \omega_n + \sqrt{4 \times 2^2 \omega_n^2 + 4 \omega_n^2}$ 
 $\omega_n = \underline{\omega}$ .

 $P_s$ ,  $P_s = -20 \times 2 + \sqrt{2^2 - 1} \times 20$ 
 $= -10 \times 2 + (0 \sqrt{2^2 - 1})$ 
 $= -7 + \pm 1.14 \text{ M}^{\frac{1}{2}}$ 

(b) Case 11:  $Z = 0.3$   $\omega_n = 10$ .

 $K_s = \omega_n^2 \times M = 10 \times 10 \times 10 = 1000 \text{ N/m}$ .

 $K_g = 2 \times 0.3 \times \sqrt{10^4} = 60 \text{ N/m}^2$ 
 $P_s$ 
 $P_s$ 

 $P_1, P_2 = -10(0.01) \pm 10\sqrt{0.01^2 - 1}$ 

 $P_1, P_2 = -0.1 \pm 9.999 \, \text{y}$

### Case 1 Plot

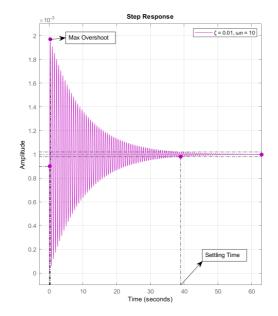

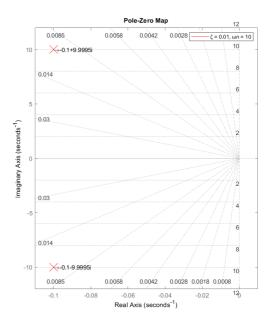

# Case 2 Plot

#### Case 3 Plot

## Conclusion/Inference

From the above results and observations, we can conclude the following

- The system in all the 3 cases is **stable** as the poles of the system in all the 3 cases are to the *left* of the Imaginary Axis on the *S-plane*
- Friction co-efficient  $K_f$  is directly proportial to  $\zeta$  , hence as  $\zeta$  decreses,  $K_f$  also decreases.
- As the value of friction co-efficient decreses, that is when the effect of friction decreases ,the number of oscillations increses, which means, there is an increase in the settling time, and also the maximum overshoot is relatively higher as seen in case 3 with ζ=0.01.
